LA7282,7282M

VCR Audio Signal Recording/  
Playback Processor

**Overview**

The LA7282 and 7282M are small package LSIs containing all functions necessary to record and playback VTR audio signal.

**Features**

- Smaller package leaves large space for other components.
- Delete of In and Output electrolysis capacitor.
- Low capacitor (0.1  $\mu$ F) for the line amp inputs (PE IN and AUDIO IN)
- Non-Adjustment of PB Gain by less gain scatter

## Pin Functions

Pin No.	Function	Terminal Circuit	Description
1	Head Switch 1 (High voltage)		EE, PB: on; REC: off On resistance: 10 $\Omega$ , typ. With stand voltage during off: $\pm 45$ V ( $f = 80$ kHz)
2	EQ AMP Input and Head Switch 2		Input playback signal to the head. Input impedance: 130 k $\Omega$ , typ. EE, REC: on; PB: off Switch on resistance: 5 $\Omega$ , typ.
3	GND		An exclusive GND for pin 1 head switch 1, EQ AMP and playback EP switch
4	EP Switch 1		Sets the tape head resonant frequency. On resistance: 15 $\Omega$ , typ. Input impedance: 120 k $\Omega$ , typ. (playback EP mode)
5	EP Switch 2		Increases the voltage gain at higher frequencies by reducing negative feedback amount of the PB EQ AMP. On resistance: 15 $\Omega$ , typ. Input impedance: 12 k $\Omega$ , typ. (playback EP mode)
6	EQ AMP NFB		Input of negative feedback of the EQ AMP to establish desired equalizing characteristics.
7	GND		Common return for all circuits except for EQ AMP and head switch 1.
8	EQ AMP Output		
9	LINE AMP PB Input		Input PB signal to the EQ AMP. The input impedance of pin 9 is high (120 k $\Omega$ ) and requires a small coupling capacitor of 0.1 $\mu$ F.
10	ALC FILTER		Connecting this pin to GND through a capacitor enables detection. The RC time constant sets attack recovery time.
11	LINE AMP Audio Input		Input EE, REC signal. Select value of $R_1$ and $R_2$ so that the reference input is at the shoulder of the ALC. The amp gain should be set for 21.5 dB. The input impedance of pin 11 is high (120 k $\Omega$ ) and requires a small coupling capacitor of 0.1 $\mu$ F.
12	ALC Detect Input		 Accepts the output signal of LINE amp. The ALC level is determined by the voltage divider consisting of $R_1$ and $R_2$ .
13	LINE AMP Output		Output impedance: 50 $\Omega$ , typ.

Pin No.	Function	Terminal Circuit	Description																								
14	REC AMP Input		Input recording signal from LINE AMP. Input current is set by the divider consisting of $R_1$ and $R_2$ . Pin 14 requires no coupling capacitor since REC AMP is to operate at zero level and as inverting amp.																								
15	LP Switch		Sets the high peaking point to the frequency suitable for LP. On resistance: 15 $\Omega$ typ. Input impedance: 60 k $\Omega$ typ.																								
16	REC AMP NFB		Connecting an L, C, R network to this pin causes a peaking frequency to rise.																								
17	REC AMP Output		Output impedance: 40 $\Omega$ typ.																								
18	Ripple Filter		Connecting an electrolytic capacitor across this pin and GND smoothes ripples.																								
19	Supply Voltage ( $V_{CC}$ )		$V_{CC} = 15$ V max $V_{CC} = 11.25 - 12.75$ V typ.																								
20	LP Control		Applying 3.5 V DC or more (6.0 V max.) to this pin turns on LP switch (pin 15). The switch turns off at 0.8 V or below.																								
21	EP Control		Applying 3.5 V DC or more (6.0 V max.) to this pin turns on EP switch (pin 4,5) and LP switch (pin 15). The switches turn off at 0.8 V or below.																								
22	MUTE Control		Applying 3.8 V DC or more (6.0 V max.) to this pin turns on mute circuit. The mute is disabled at 1.0 V or below. [Control mode]
